# Block-State Entropy Curve

We have looked at:  $H[X_{0:\ell}] = H[X_0, X_1, \dots, X_\ell]$

# Block-State Entropy Curve

We have looked at:  $H[X_{0:\ell}] = H[X_0, X_1, \dots, X_\ell]$

But if we have the  $\epsilon$ -machine for a process, we can also look at:

$$H[X_{0:\ell}, \mathcal{S}_\ell] = H[X_0, X_1, \dots, X_\ell, \mathcal{S}_\ell]$$

## Block-State Entropy Curve

We have looked at:  $H[X_{0:\ell}] = H[X_0, X_1, \dots, X_\ell]$

But if we have the  $\epsilon$ -machine for a process, we can also look at:

$$H[X_{0:\ell}, \mathcal{S}_\ell] = H[X_0, X_1, \dots, X_\ell, \mathcal{S}_\ell]$$

What would we want to do this?

## Block-State Entropy Curve

We have looked at:  $H[X_{0:\ell}] = H[X_0, X_1, \dots, X_\ell]$

But if we have the  $\epsilon$ -machine for a process, we can also look at:

$$H[X_{0:\ell}, \mathcal{S}_\ell] = H[X_0, X_1, \dots, X_\ell, \mathcal{S}_\ell]$$

What would we want to do this?

- Combine both observed information and state information

# Block-State Entropy Curve

We have looked at:  $H[X_{0:\ell}] = H[X_0, X_1, \dots, X_\ell]$

But if we have the  $\epsilon$ -machine for a process, we can also look at:

$$H[X_{0:\ell}, \mathcal{S}_\ell] = H[X_0, X_1, \dots, X_\ell, \mathcal{S}_\ell]$$

What would we want to do this?

- Combine both observed information and state information
- $H[X_{0:0}, \mathcal{S}_0] = C_\mu$

## Block-State Entropy Curve

We have looked at:  $H[X_{0:\ell}] = H[X_0, X_1, \dots, X_\ell]$

But if we have the  $\epsilon$ -machine for a process, we can also look at:

$$H[X_{0:\ell}, \mathcal{S}_\ell] = H[X_0, X_1, \dots, X_\ell, \mathcal{S}_\ell]$$

What would we want to do this?

- Combine both observed information and state information
- $H[X_{0:0}, \mathcal{S}_0] = C_\mu$
- This curve gives us the crypticity

# Block-State Entropy Curve

We have looked at:  $H[X_{0:\ell}] = H[X_0, X_1, \dots, X_\ell]$

But if we have the  $\epsilon$ -machine for a process, we can also look at:

$$H[X_{0:\ell}, \mathcal{S}_\ell] = H[X_0, X_1, \dots, X_\ell, \mathcal{S}_\ell]$$

What would we want to do this?

- Combine both observed information and state information
- $H[X_{0:0}, \mathcal{S}_0] = C_\mu$
- This curve gives us the crypticity
- Limits to the same asymptote as the block entropy

# Markov and Cryptic Orders

## Definition

The *Markov order* of a process is:

$$R = \operatorname{argmin}_{\ell} \{ \Pr(X_0 | X_{-\ell:0}) = \Pr(X_0 | X_{:0}) \}$$

# Markov and Cryptic Orders

## Definition

The *Markov order* of a process is:

$$\begin{aligned} R &= \operatorname{argmin}_{\ell} \{ \Pr(X_0 | X_{-\ell:0}) = \Pr(X_0 | X_{:0}) \} \\ &= \operatorname{argmin}_{\ell} \{ H[\mathcal{S}_{\ell} | X_{0:\ell}] = 0 \} \end{aligned}$$

# Markov and Cryptic Orders

## Definition

The *Markov order* of a process is:

$$\begin{aligned} R &= \operatorname{argmin}_{\ell} \{ \Pr(X_0 | X_{-\ell:0}) = \Pr(X_0 | X_{:0}) \} \\ &= \operatorname{argmin}_{\ell} \{ H[\mathcal{S}_{\ell} | X_{0:\ell}] = 0 \} \end{aligned}$$

## Definition

The *cryptic order* of a process is:

$$k_{\chi} = \operatorname{argmin}_{\ell} \{ H[\mathcal{S}_{\ell} | X_{0:}] = 0 \}$$

## Problems With This Approach

What things did we assume when we computed the Markov and cryptic orders?

## Problems With This Approach

What things did we assume when we computed the Markov and cryptic orders?

- Knew **E** exactly

## Problems With This Approach

What things did we assume when we computed the Markov and cryptic orders?

- Knew  $\mathbf{E}$  exactly
- Knew  $h_\mu$  exactly

# Problems With This Approach

What things did we assume when we computed the Markov and cryptic orders?

- Knew  $\mathbf{E}$  exactly
- Knew  $h_\mu$  exactly
- Could differentiate *exactly on* the asymptote from *less than machine precision away from* the asymptote

## Problems With This Approach

What things did we assume when we computed the Markov and cryptic orders?

- Knew  $\mathbf{E}$  exactly
- Knew  $h_\mu$  exactly
- Could differentiate *exactly on* the asymptote from *less than machine precision away from* the asymptote
- Could “guess” when  $R$  or  $k_\chi$  were infinite, else we’d be computing block entropies indefinitely

# A Hint of a Solution

# A Hint of a Solution

# A Hint of a Solution

Markov and cryptic orders are *independent* of the probabilities!

# A Hint of a Solution

Markov and cryptic orders are *independent* of the probabilities!  
 They depend only on the *topology* of the  $\epsilon$ -machine!

# Improvements

In what ways have we improved over the original method of computing  $R$  and  $k_\chi$ ?

# Improvements

In what ways have we improved over the original method of computing  $R$  and  $k_\chi$ ?

- Don't need  $\mathbf{E}$  or  $h_\mu$

# Improvements

In what ways have we improved over the original method of computing  $R$  and  $k_\chi$ ?

- Don't need  $\mathbf{E}$  or  $h_\mu$
- Integer based, so don't need to worry about machine precision

# Improvements

In what ways have we improved over the original method of computing  $R$  and  $k_\chi$ ?

- Don't need  $\mathbf{E}$  or  $h_\mu$
- Integer based, so don't need to worry about machine precision
- But ... There could be an arbitrary number of synchronizing words, each of arbitrary length

# Further Improvements

Can we do even better than this method?

# Further Improvements

Can we do even better than this method?

- Yes!

## Further Improvements

Can we do even better than this method?

- Yes!
- We can check all synchronizing words in *parallel* by analyzing and manipulating the graph structure of the  $\epsilon$ -machine

## Further Improvements

Can we do even better than this method?

- Yes!
- We can check all synchronizing words in *parallel* by analyzing and manipulating the graph structure of the  $\epsilon$ -machine
- For details on that, see Ryan G. James, John R. Mahoney, Christopher J. Ellison, James P. Crutchfield: *Many Roads to Synchrony: Natural Time Scales and Their Algorithms*
