

# Brief Introduction to Python

Stefan Pfenninger

1 Key features

2 Language basics

3 Example

# ① How to run Python

Code → Compiler → Executable

Code → Interpreter  
↑

① Create a script file (.py)

② Use the interpreter interactively

## ② Dynamic typing

Variables do not need to be declared

Variables do not need to stick to a specific type

### ③ Whitespace has meaning

C

```
if (x > 1)
{
    y = 10
    z = 0
} else {
    y = 5
    z = 5
}
```

Python

```
if x > 1:
    . . . . y = 10
    . . . . z = 0
else:
    . . . . y = 5
    . . . . z = 5

print y
```

## ④ Everything in Python is an object

`0.25` is a `Float` object

= instance of the Class `Float`.

The class defines methods, such as:

- `Float.is_integer()`
- `Float.real()`
- `Float.imag()`
- ...

## ④ Objects

```
>>> x = 0.25
```

Declaring a variable: equivalent to creating an object

Objects have a **class**, which defines **methods** that operate on the object

```
>>> x.is_integer()  
False
```

## ⑤ Packages and namespaces

```
>>> import math
```

```
>>> math.floor(1.99)
```

```
1.0
```

- Namespaces mean that it's always exactly clear where a certain function came from, which keeps code clear and organized

## ⑤ 3rd-party packages

- About 45,000 packages available
- For example: packages for reading almost any imaginable data format with ease
- “import” to use installed packages:

```
import package_name
```

## ⑤ Key scientific packages

NumPy

n-dimensional arrays/matrices

SciPy

basic science/stats, numerical analysis

Sympy

symbolic maths

matplotlib

plotting

pandas

time series and tabular data

IPython

interactive Python “lab”

1 Key features

2 Language basics

3 Examples

# The IPython notebook

- Combines interactive interpreter with the ability to save a file for later use
- Very useful for explorative analysis
- Organize code, comments, and results (e.g. plots) together in one file

# IPython Notebook: Intro to Python

<http://nbviewer.ipython.org/gist/sjpfenninger/0b96957f27e2a61123ce>

1 Key features

2 Language basics

3 Examples

# IPython Notebook: NetworkX + IPython

<http://nbviewer.ipython.org/gist/sjpfenninger/034053040ab23fcbb95b>

Additional notes

## Other important scientific packages

- Statistical modeling: statsmodels, seaborn
- Machine learning: scikit-learn
- Bayesian statistics: pymc
- GIS: geopandas, shapely, pysal, and others
- Mathematical optimization: pyomo
- Networks: networkx

# Which Python version to use?

Free Anaconda distribution: includes all common scientific packages, makes updating easy

<https://store.continuum.io/cshop/anaconda/>

Documentation is here:

<http://docs.continuum.io/anaconda/index.html>

## What editor to use?

- My choice: a simple text editor (Sublime Text) in combination with IPython notebook
- Spyder is a Matlab-like IDE that is included in the Anaconda distribution:  
<https://pythonhosted.org/spyder/>
- PyCharm is a full-featured IDE with a free community edition:  
<https://www.jetbrains.com/pycharm/>

# How to learn: Documentation

- Interactive learning environments:  
<http://www.learnpython.org/>  
and <http://www.codecademy.com/tracks/python>
- Official Tutorial & Dos and Dont's:  
<http://docs.python.org/2.7/tutorial/index.html>  
<http://docs.python.org/2/howto/doanddont.html>
- The Hitchhiker's Guide to Python:  
<http://docs.python-guide.org/en/latest/>

## How to learn

- Follow code style guidelines: [docs.python-guide.org/en/latest/writing/style/](https://docs.python-guide.org/en/latest/writing/style/)
- Search for answers on [stackoverflow.com](https://stackoverflow.com) — many questions are already answered
- Start learning about advanced language features: e.g. <https://stackoverflow.com/questions/101268/hidden-features-of-python>

# How to learn: Scientific Python

- Lots of material, primarily on numpy/scipy:  
<http://scipy-lectures.github.io/>
- Lectures with IPython notebooks:  
<http://www.astro.washington.edu/users/vanderplas/Astr599/schedule>
- Blog with many examples (searchable):  
<http://glowingpython.blogspot.com/>

## How to find packages

- Google: python + the thing you want to do
- Search the Python Package Index, PyPI:  
<http://pypi.python.org/>

## How to install packages

- With anaconda, try “conda install <package>” in a terminal window
- If that doesn't work, try “pip install <package>”
- If that doesn't work, read the package docs

# Python 3 vs 2

- Python 3 is still *in the process of* replacing 2
- Major scientific packages support Python 3
- But many tutorials, websites, books, etc, still based on Python 2
- Anaconda installs Python 2 by default but can easily switch to Python 3
- Easiest to start learning with Python 2 and switch to 3 later when it has become more completely established
