Research
Initiative**

Smart Cities

The Age of Big Data

The New Urban Science

Urban Informatics

The Age of Big Data

Outline

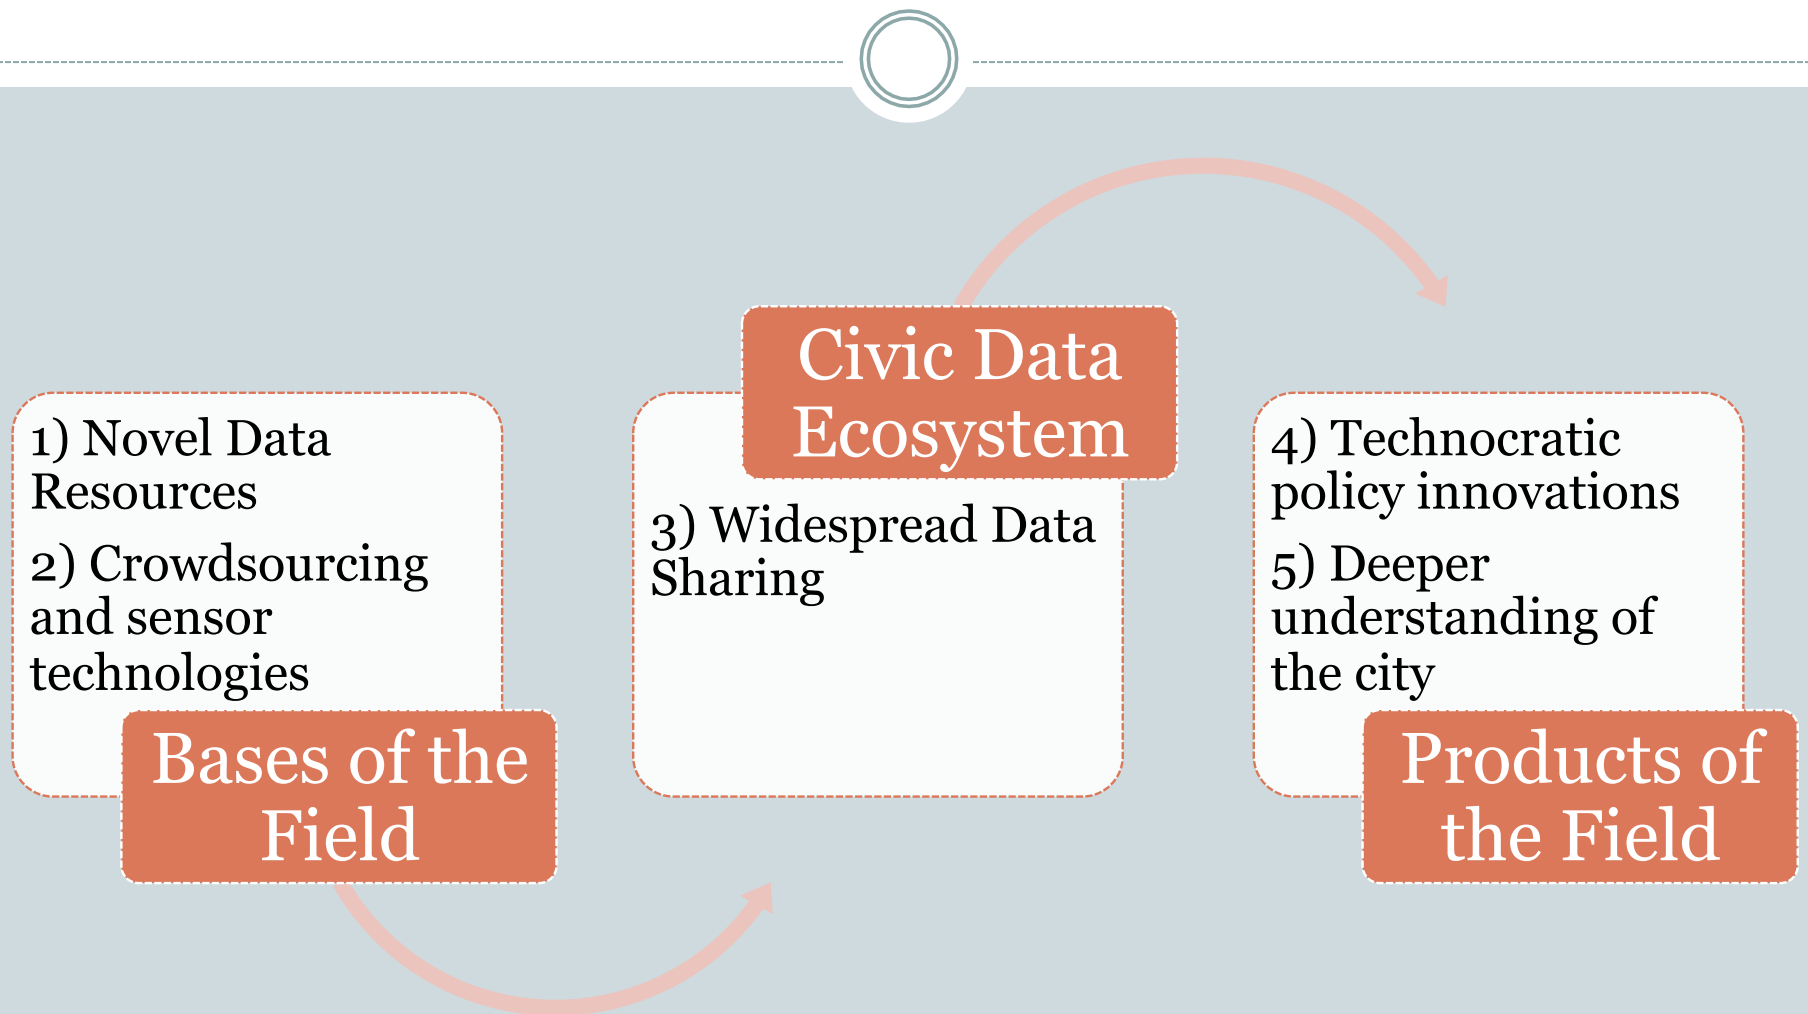

- The Field of Urban Informatics
- The Problem of Naturally-Occurring Data: 311 and Broken Windows
- Advancing Science and Policy

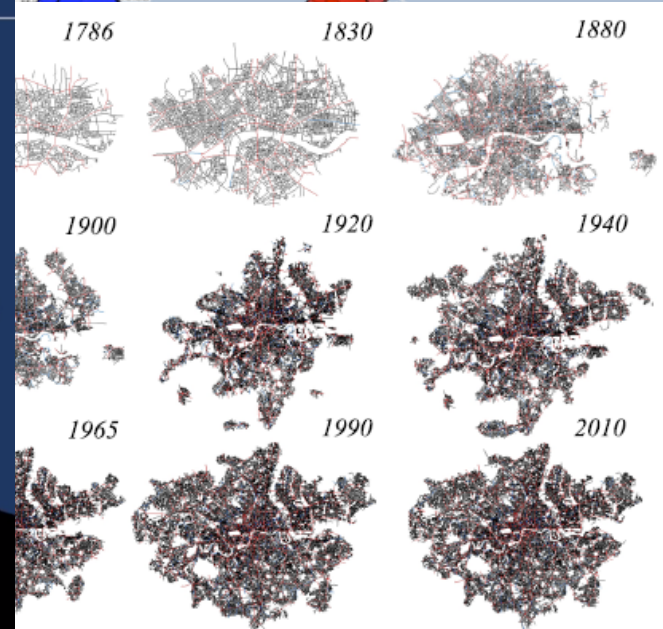

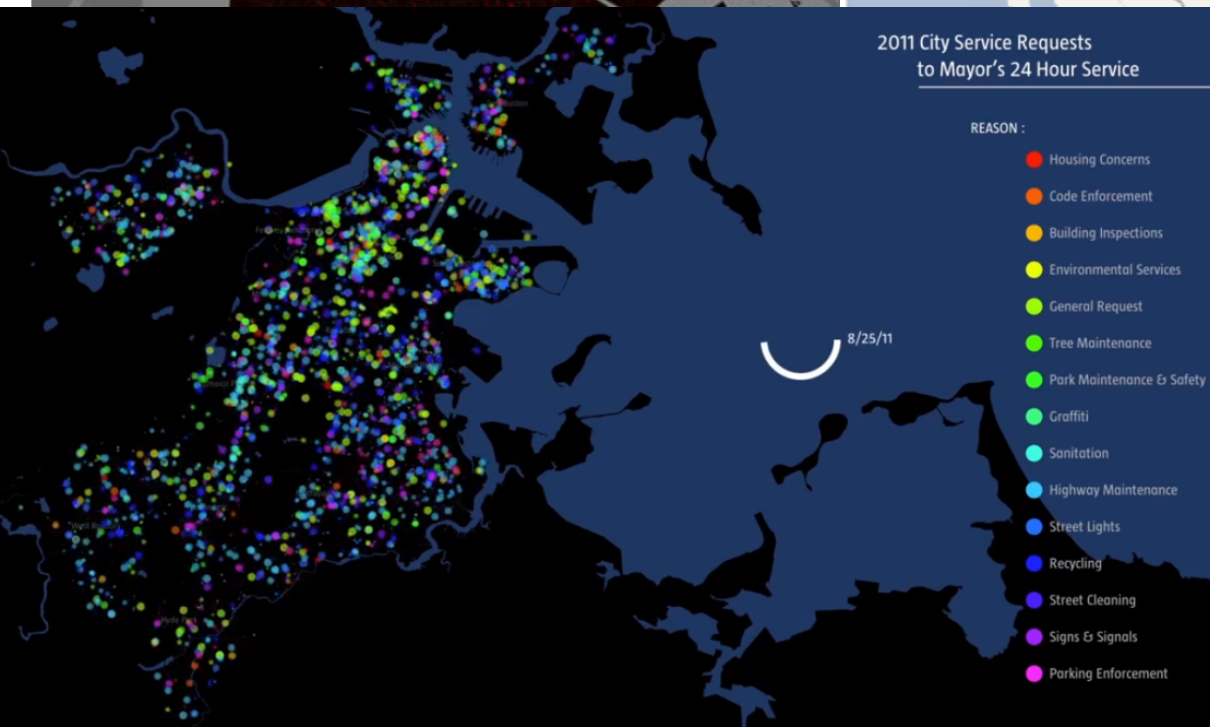

The Field of Urban Informatics

5 Themes of Urban Informatics

Bases of the Field: Novel Data Resources

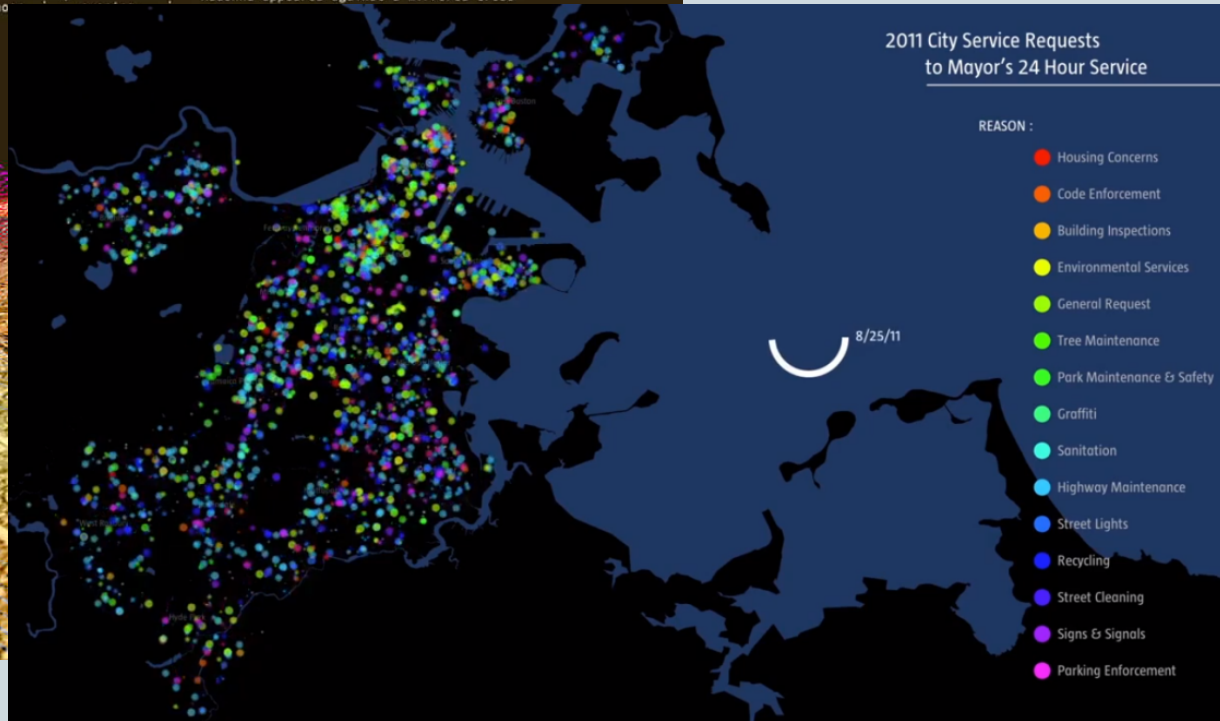

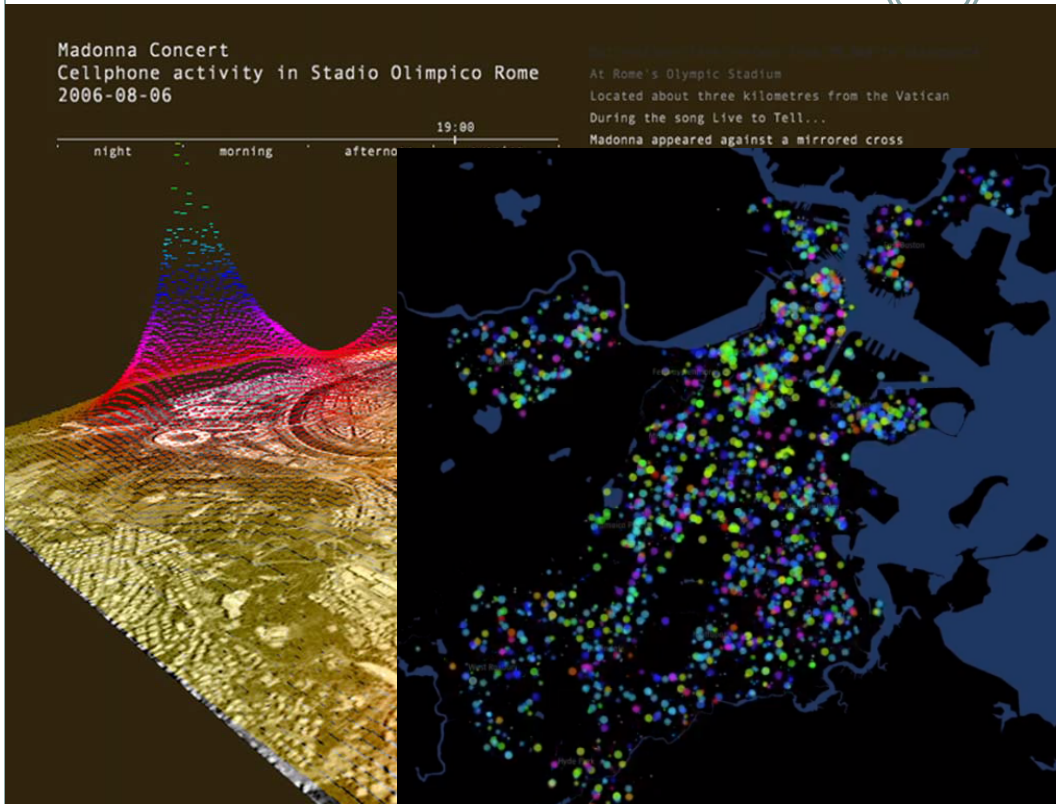

Bases of the Field: Crowdsourcing and Sensor Technologies

- Sensors tracking environment (e.g., weather), atmosphere (e.g., pollutants), and activity (e.g., pedestrians).

Bases of the Field: Crowdsourcing and Sensor Technologies

Bases of the Field: Crowdsourcing and Sensor Technologies

- A composite view of the city
- Diverse in content, spatially and temporally precise
- Intimate access to the *pulse of the city*.

5 Themes of Urban Informatics

- 1) Novel Data Resources
- 2) Crowdsourcing and sensor technologies

Bases of the Field

Civic Data Ecosystem

- 3) Widespread Data Sharing

Civic Data Ecosystem

Ecosystem: The community of species of organisms that inhabit a space, the physical characteristics of that space, and the interactions among them.

Present Media

City Government

Private Sector

The Boston Area Research Initiative

- An interuniversity partnership that pursues urban research that advances both scholarship and policy.
- With a primary focus on the opportunities presented by novel digital data and technologies.
 - Faculty co-Directors Dan O'Brien, Robert Sampson, and Christopher Winship
 - www.bostonarearesearchinitiative.net
 - Part of the MetroLab Network, a federally-sponsored national consortium of city-university partnerships.

**Boston
Area
Research
Initiative**

A diagram consisting of two large, solid orange circles positioned horizontally. A thin, horizontal yellow line connects the right edge of the left circle to the left edge of the right circle. The left circle contains the word "University" in white serif font. The right circle contains the words "City" and "Government" in white serif font, stacked vertically. The entire diagram is set against a light blue background with a darker blue horizontal bar at the bottom.

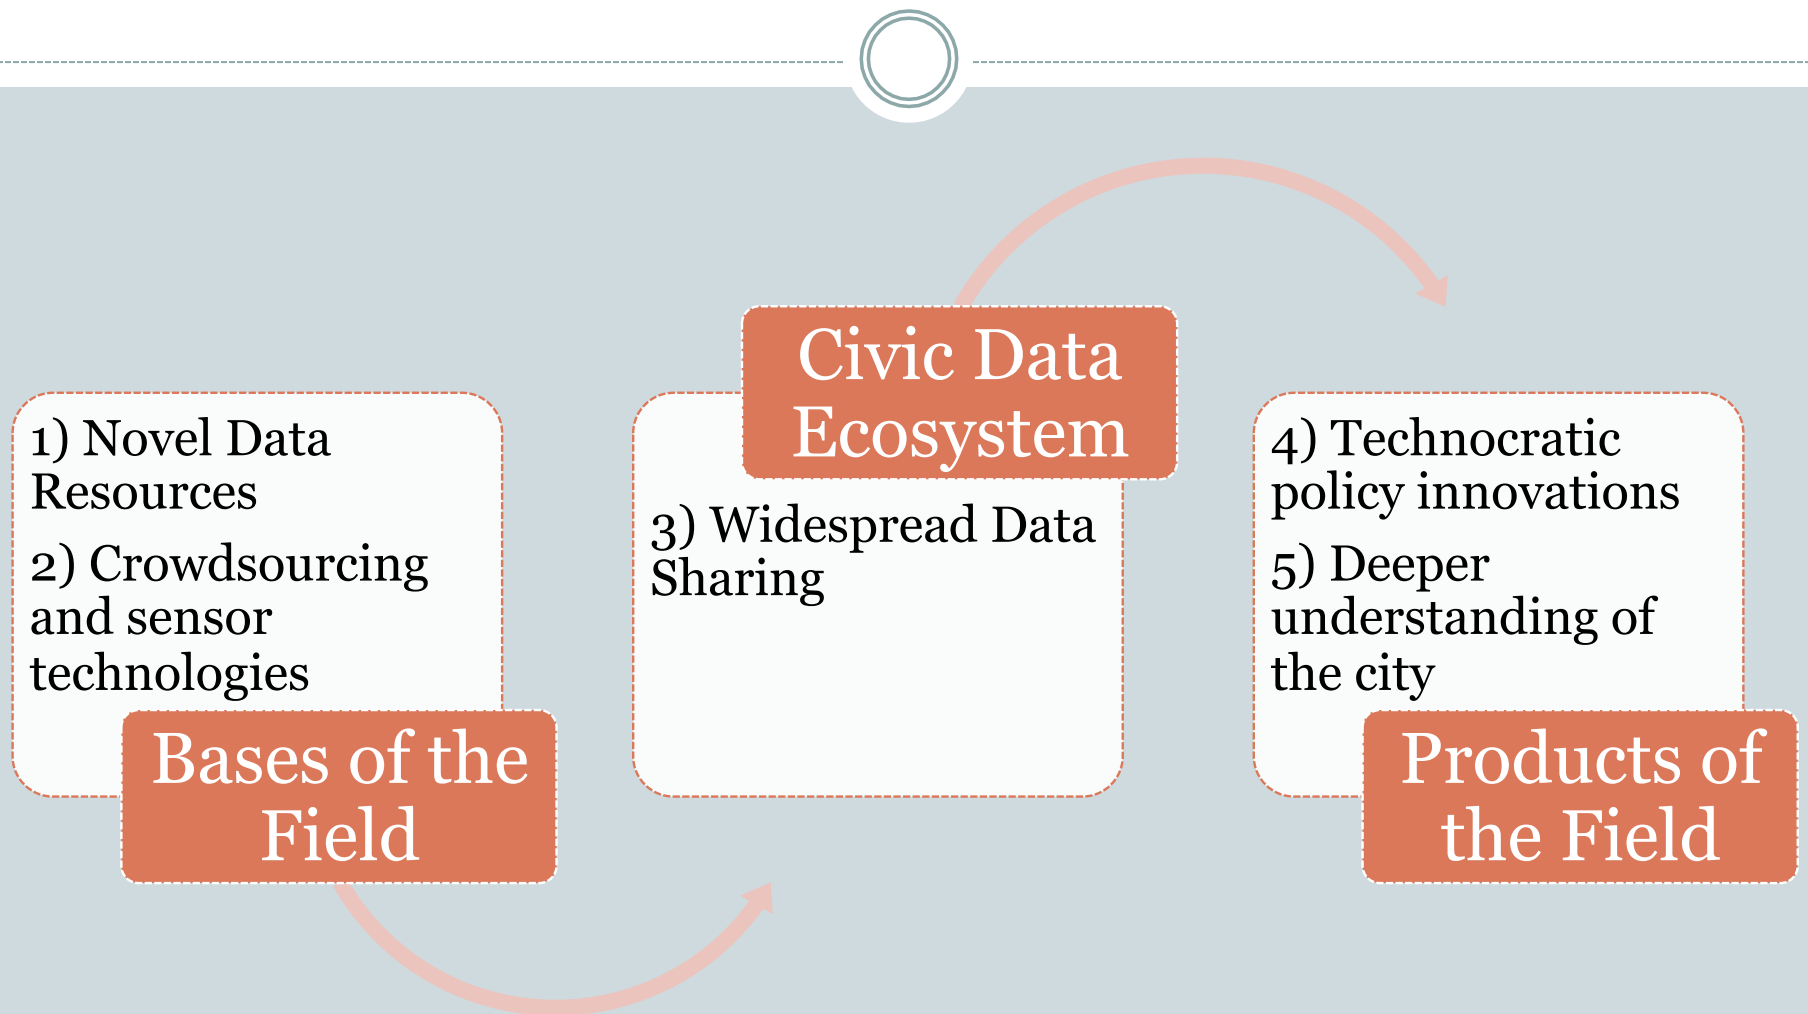

University

City
Government

5 Themes of Urban Informatics

Products of the Field: Technocratic Policy Innovations

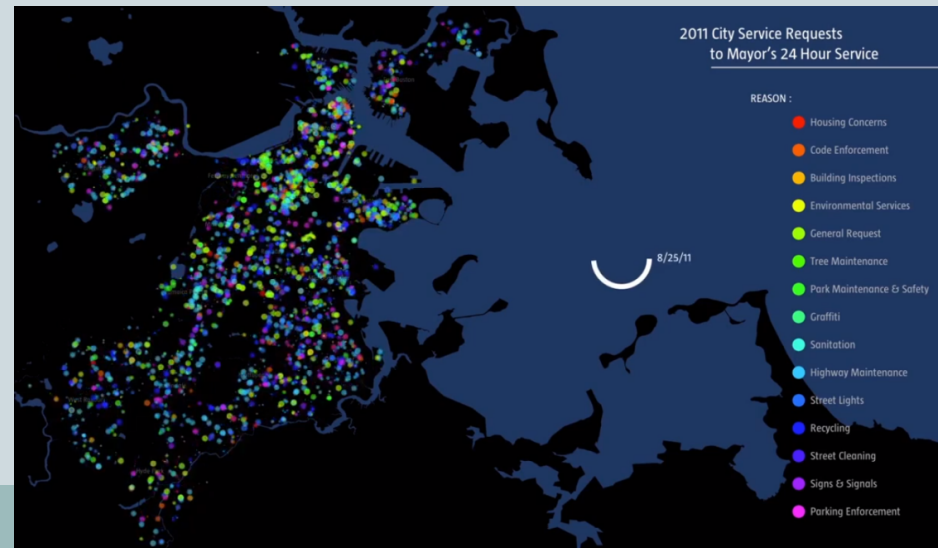

- Gov 2.0 / civic technology
- Dashboards
- New policies, practices, and systems
 - Engineering
 - ✦ South Bend's backflow resistant sewers
 - ✦ New York City's safer streets
 - Social
 - ✦ Microgeographical prediction and management of crime.
 - ✦ Integrated Data Systems and associated efforts.

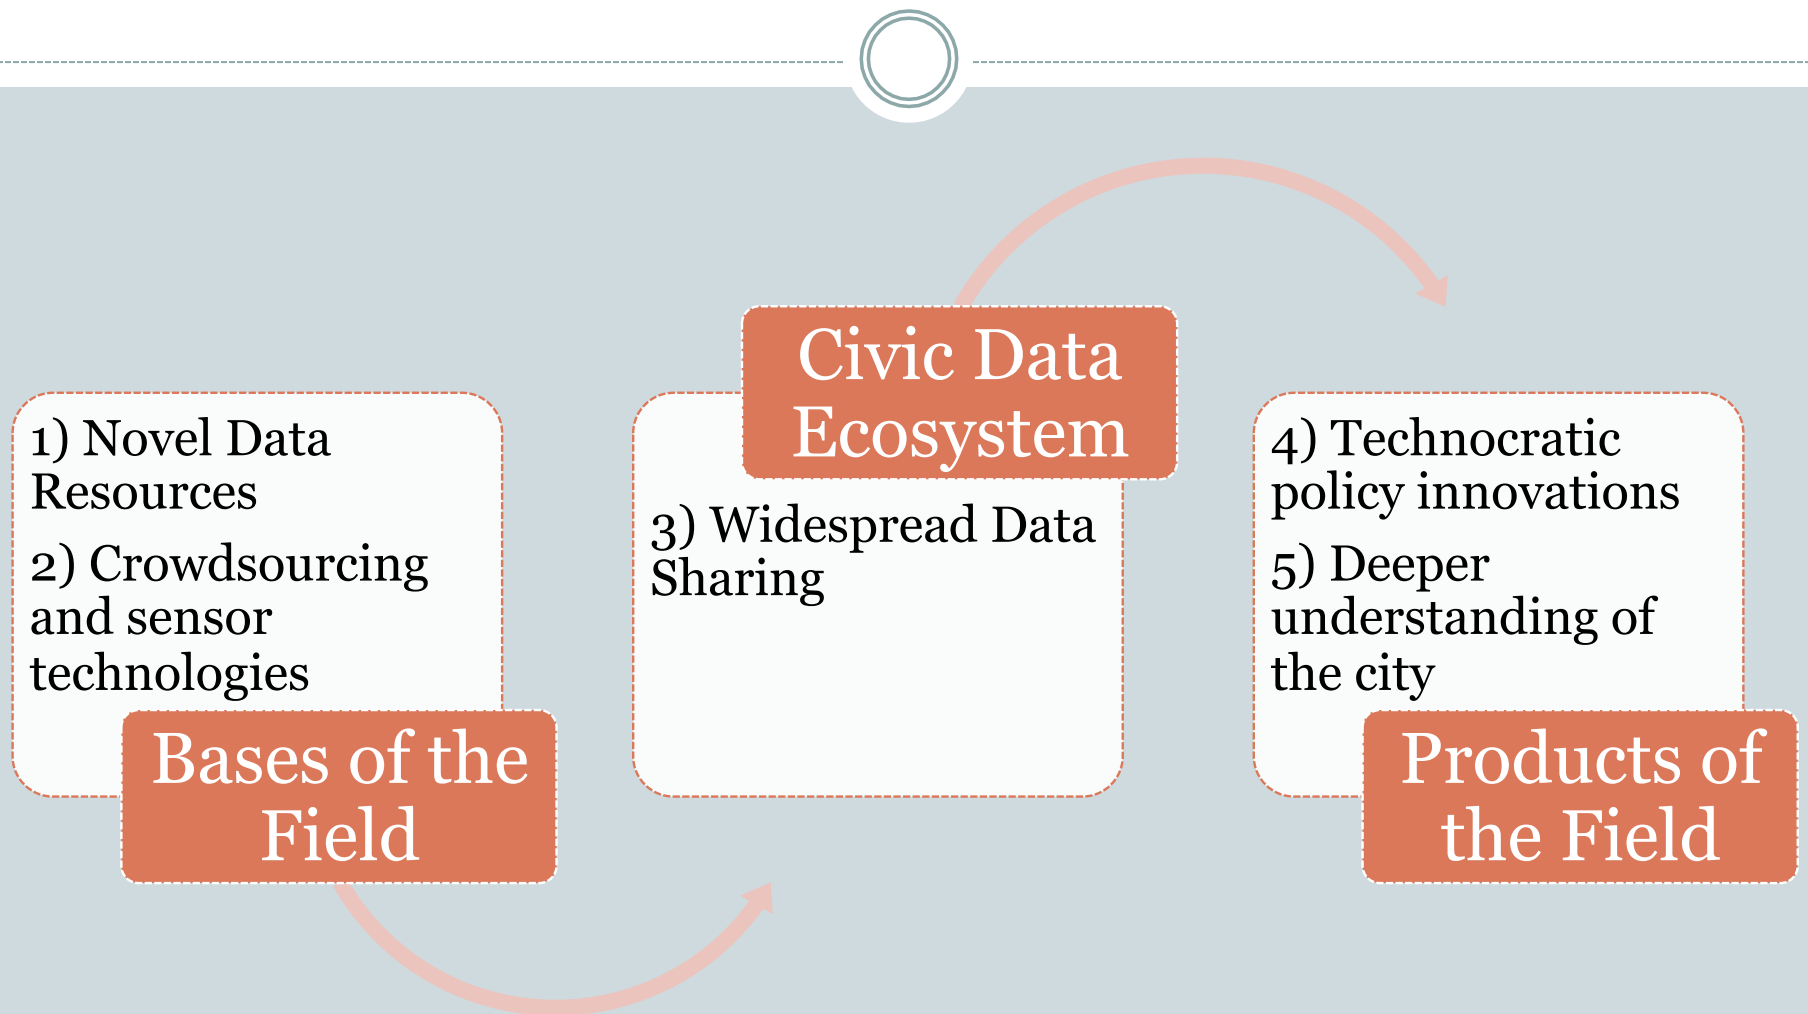

Products of the Field: Deeper Understanding of the City

- 311 illustrates multiple opportunities from a single data set:
 - “Eyes and ears of the city” tracking neighborhood conditions.
 - Window onto neighborhood maintenance.
 - Assessing government-public relations.
 - Examining the effectiveness of civic technology

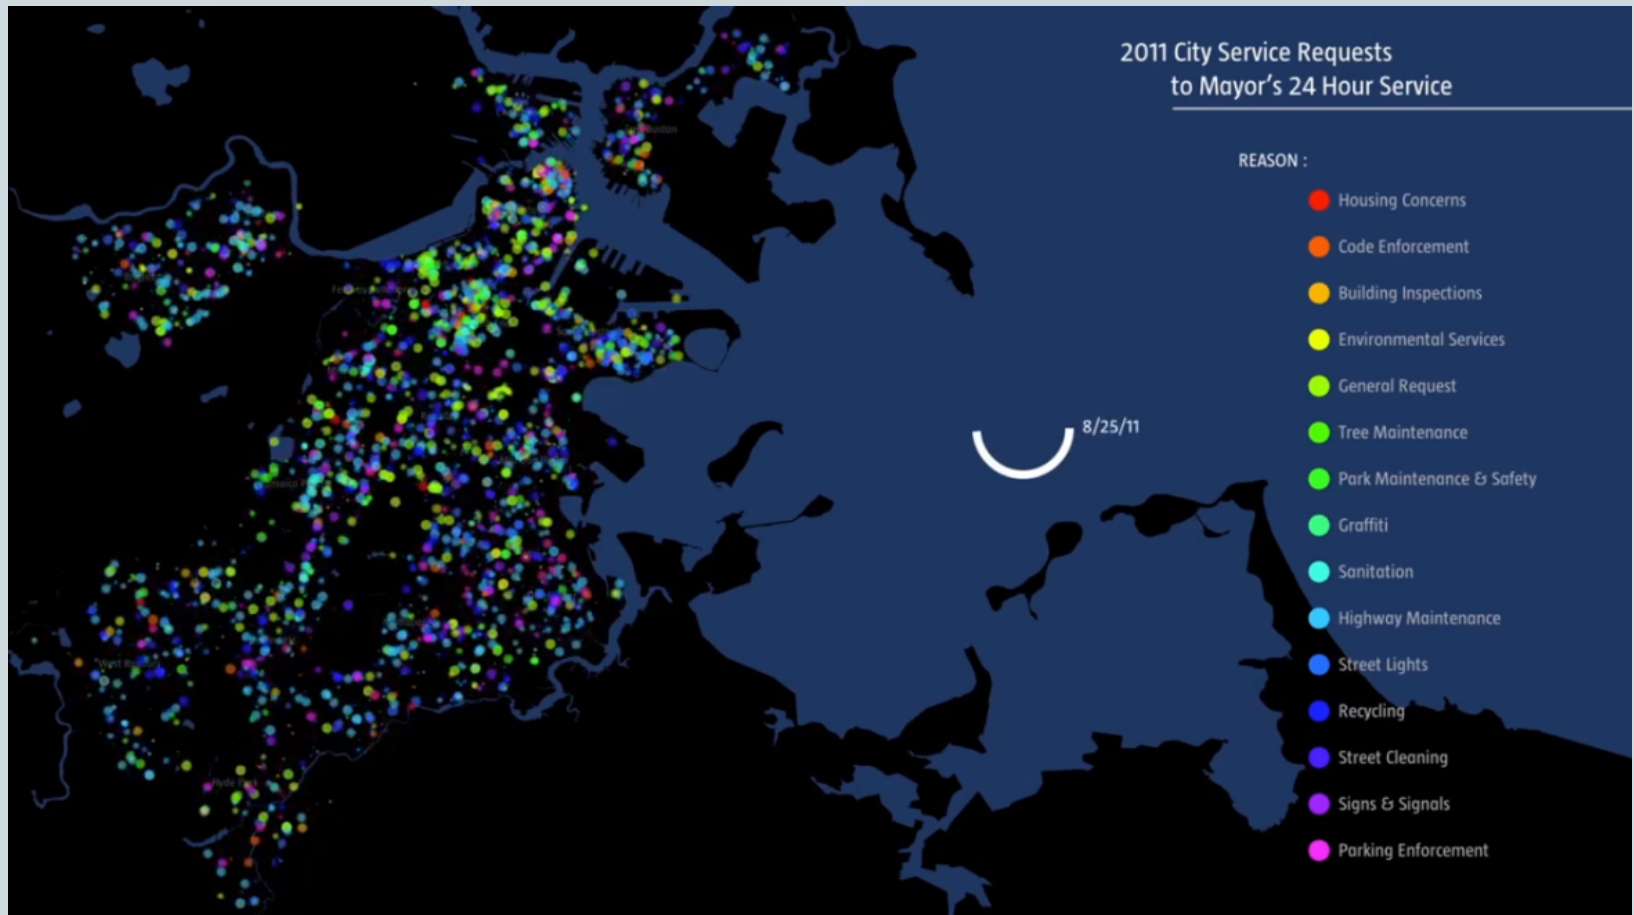

5 Themes of Urban Informatics

The Problem of “Big Data”

The Problem of “Big Data”

The Problem of Naturally-Occurring Data

1. *Content*: What is it we're trying to measure?
2. *Validity*: Do the cases measure “real” conditions?
3. *Reliability*: How often and for what geographic scale can they be measured?

Collaboration around the 311 System

- 2008: Boston instated the Constituent Relationship Management System (i.e., 311).
- Now receives ~500 requests/ day.
- How do we leverage these data to inform both public policy and social science?

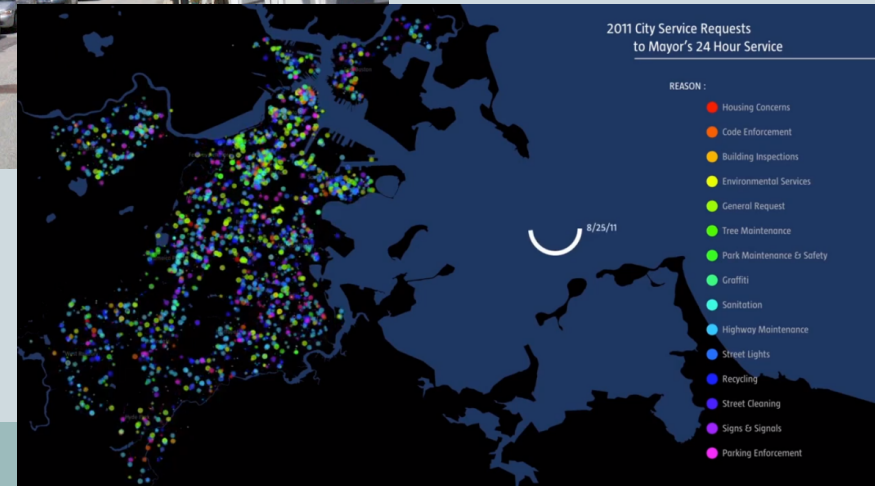

Ecometrics

- Measuring the characteristics of the physical and social ecology of a neighborhood.

- Surveys of residents
- Systematic social
- Key informants
- Administrative data

An Econometric Methodology for Big Data: What's Missing?

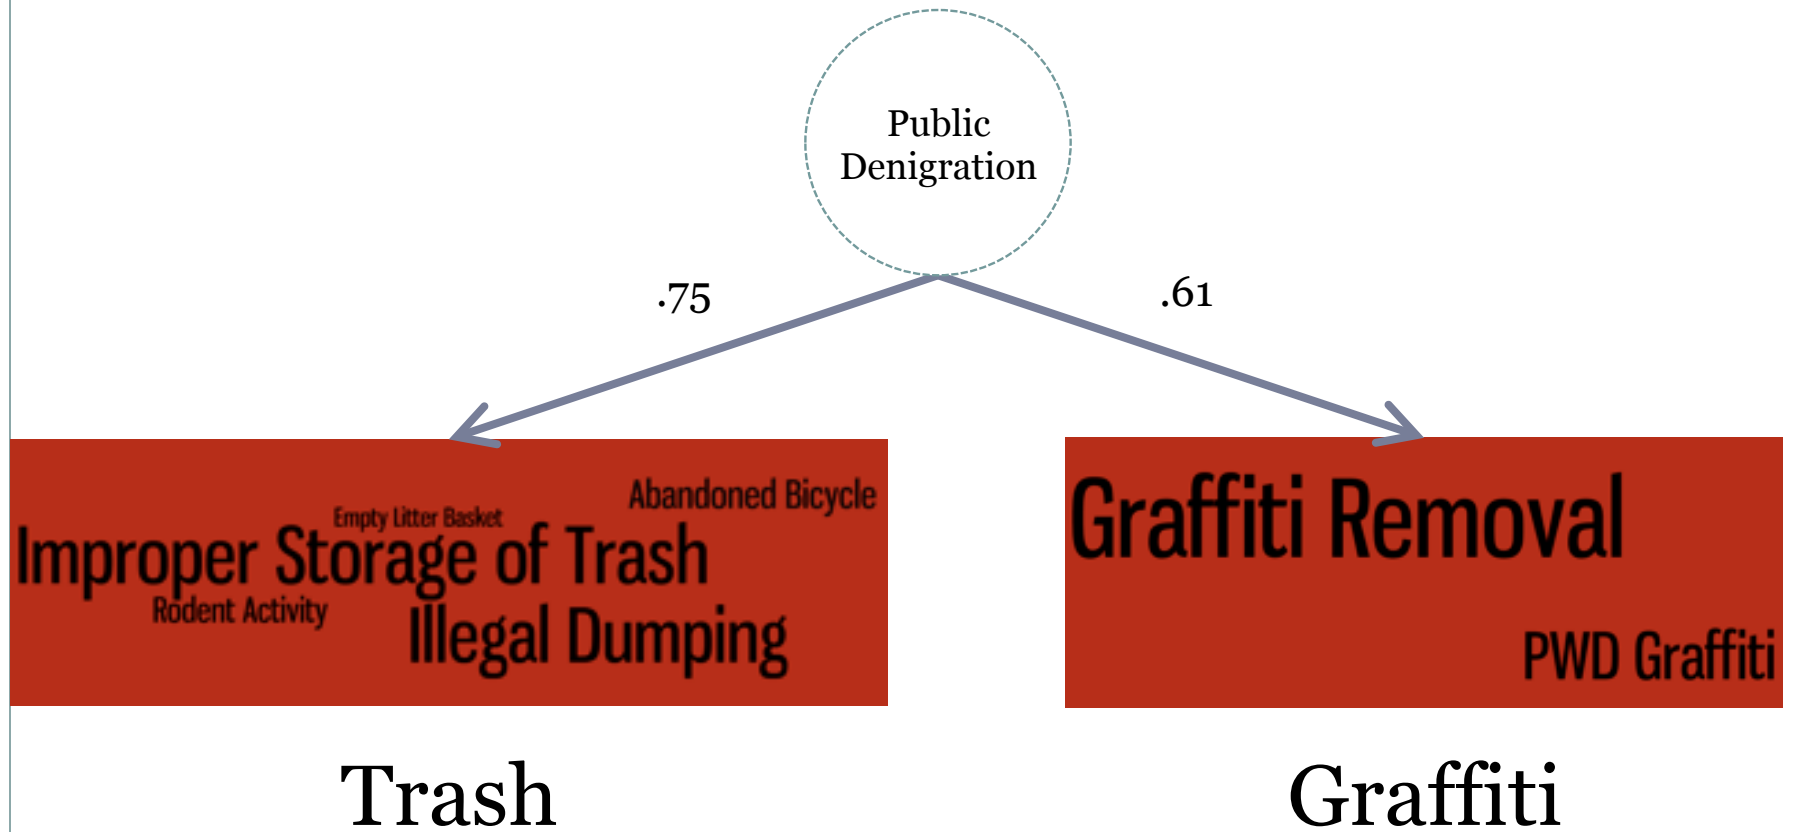

1. *Content*: What is it we're trying to measure?
 - How do we focus our analysis specifically on disorder?
2. *Validity*: Do the cases measure “real” conditions?
 - What if patterns of calling don't reflect ground truth?
3. *Reliability*: How often and for what geographic scale can they be measured?
 - Census block groups or tracts? Repeated measures?

Using the 311 Database

- Database from March 1, 2010-June 29, 2012.
 - 334,874 cases.
- Each case includes:
 - Date and time.
 - Address or intersection.
 - Standardized case type (e.g., pothole, graffiti removal).
 - Anonymous caller identifier.
- Analysis uses census block groups ($N = 543$).
- Step 1: Identifying and Categorizing Relevant Case Types

Private
Neglect

.81

.35

.65

Pest Infestation – Residential
Heat – Excessive, Insufficient
Unsatisfactory Living Conditions
Chronic Dampness/Mold
Mice Infestation
Bed Bugs
Breathe Easy
Maintenance Complaint – Residential
Unsatisfactory Utilities – Electrical, Plumbing

Housing Issues

Big Buildings Enforcement
Big Buildings Resident Complaint
Big Buildings Online Request

Problems w Big
Buildings

Abandoned Building
Illegal Occupancy
Poor Conditions of Property
Parking on Front/Back Yards
Illegal Rooming House
Trash on Vacant Lot
Maintenance – Homeowner

Uncivil Use of Space

Step 2: Validity

- Does the archive of calls accurately reflect real conditions across the city?

Adjusting for Civic Responsiveness

- An objective measurement of civic response rate.
 - Identified 244 street light outages across Boston.
 - Public Works assessed quality of all sidewalks.
- Additional measures from within the 311 database to estimate civic response rate.
 - Registered users reporting “public” issues
 - Registered users reporting more than 2 “public” issues/year

Civic Responsiveness across Boston

External Validation of 311-Based Private Neglect and Public Denigration

	Private Neglect	Public Denigration
<i>Median Income</i>	-.49***	-.19***
<i>Homeownership</i>	-.33***	-.30***
<i>% Black</i>	.49***	-.07
<i>% Hispanic</i>	.29***	.17***
<i>Collective Efficacy</i>	-.37***	-.19***
<i>Perceived Physical Disorder</i>	.36***	.21***
<i>Gun-Related Incidents</i>	.53***	.13***

Note: $N = 428$ residential census block groups.

*** - $p < .001$

Final Measures of Physical Disorder

- Multi-dimensional
 - Five lower-order and two higher-order measures
- Nearly costless
- Continuous across time and space
 - Can be measured every two to six months.

“Seeing” Boston Neighborhoods through Administrative Data

Private Neglect

Public Denigration

Additional Ecometrics: 311 Usage

Engagement

Custodianship

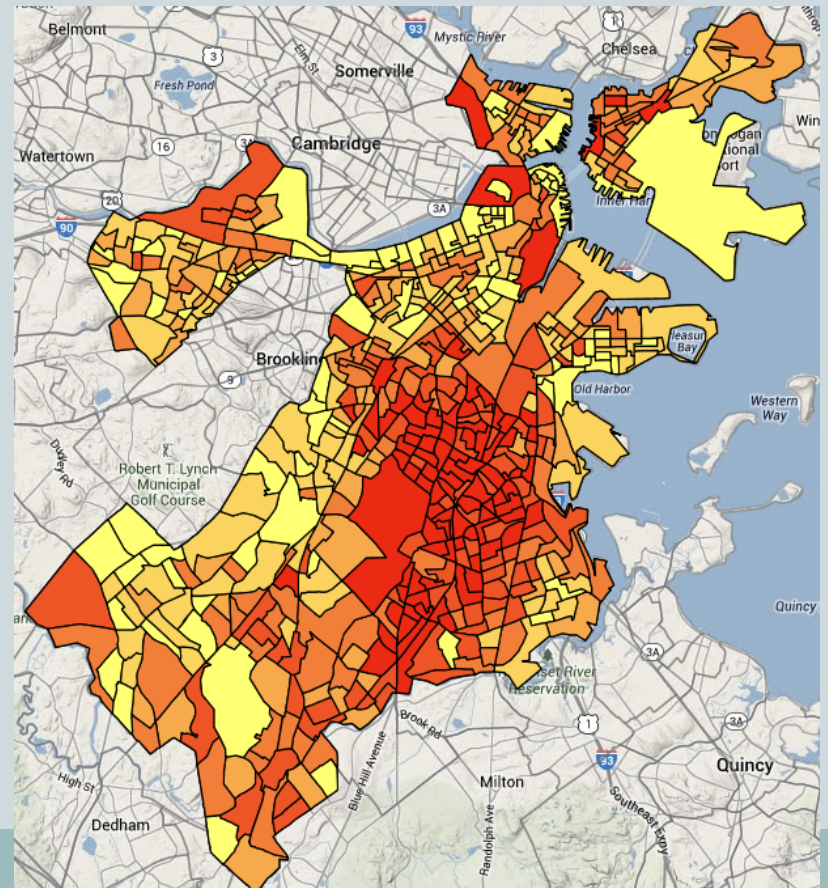

Additional Ecometrics: 911 Calls for Disorder and Crime

Public Violence

Private Conflict

Additional Ecometrics: 911 Calls for Medical Emergencies

Late-Life Emergencies

Youth and Reproductive

Additional Ecometrics: Building Permits

Major Developments

Local Investment & Growth

Additional Ecometrics: Property Value Trends

Loss during Recession

Growth during Recovery

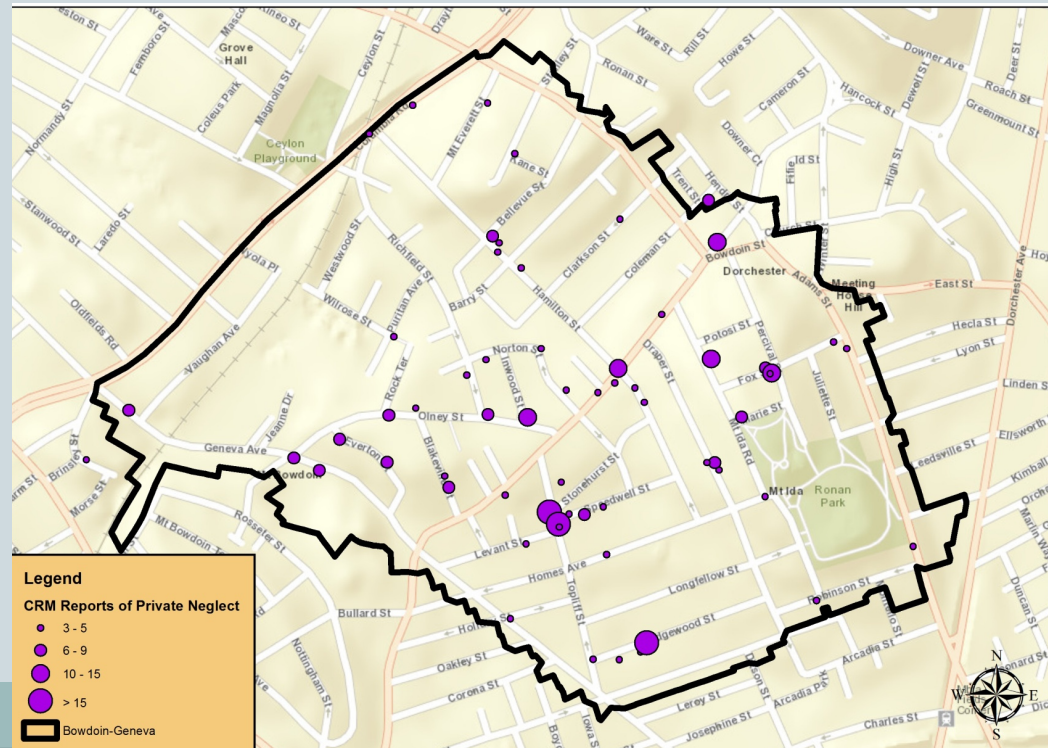

Advancing Science and Policy

Use in Science, Policy and Practice

- Interpreting microspatial patterns

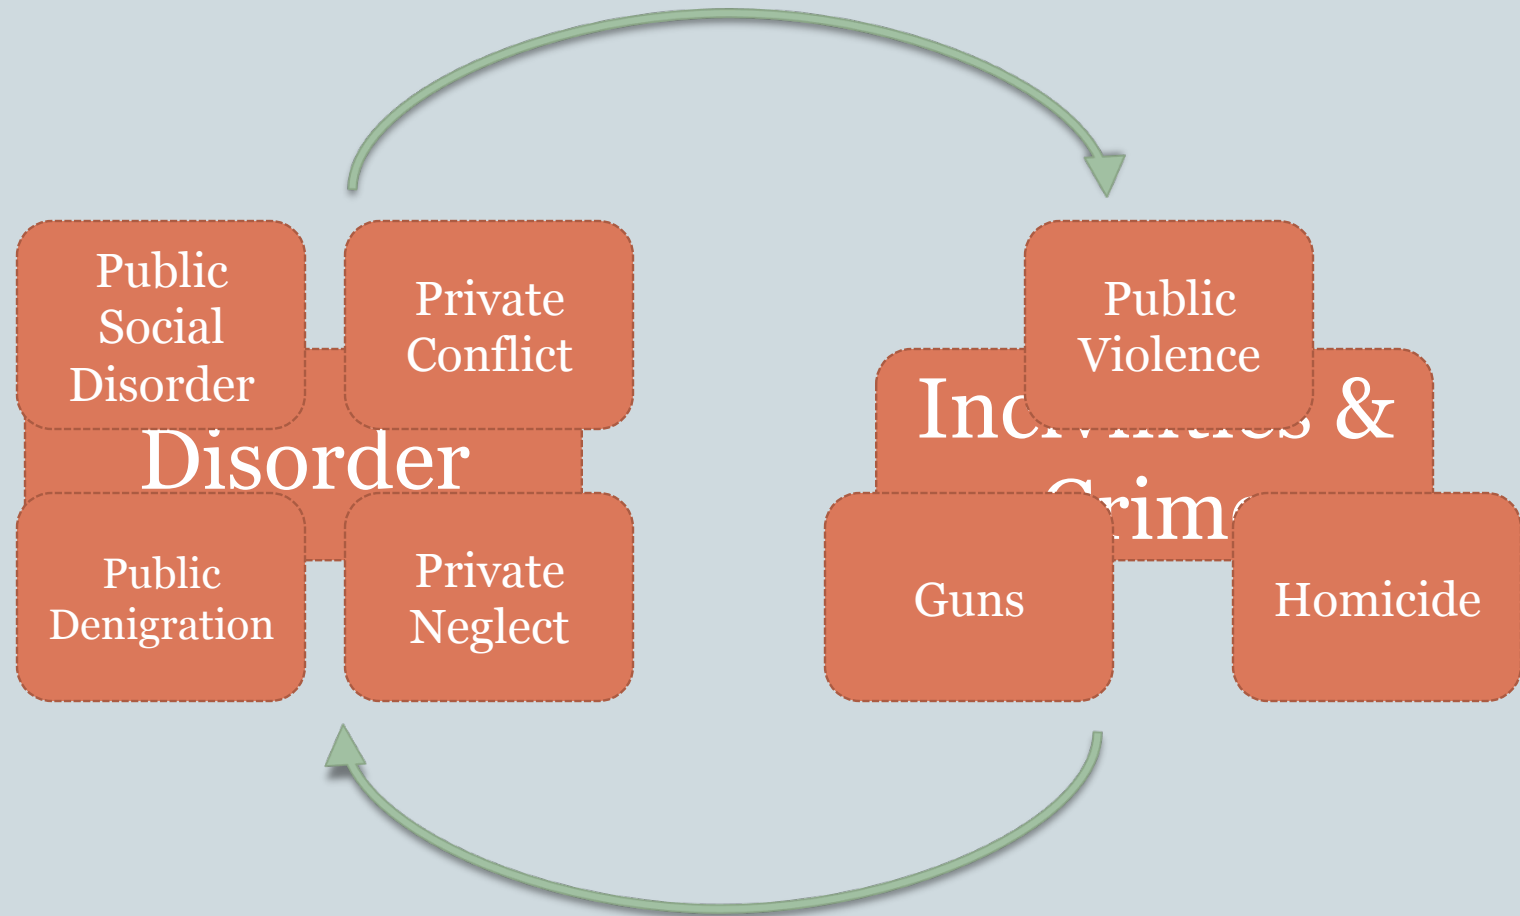

Use in Science, Policy and Practice

- Interpreting microspatial patterns
- Examining dynamic relationships
 - Testing broken windows theory

Broken Windows Theory: The Cycle of Disorder and Decline

Use in Science, Policy and Practice

- Interpreting microspatial patterns
- Examining dynamic relationships
- Combining with traditional methodologies
 - Survey of 311 users with Emerson College.

Use in Science, Policy and Practice

- Interpreting microspatial patterns
- Examining dynamic relationships
- Combining with traditional methodologies
- Supporting neighborhood interventions and experiments.

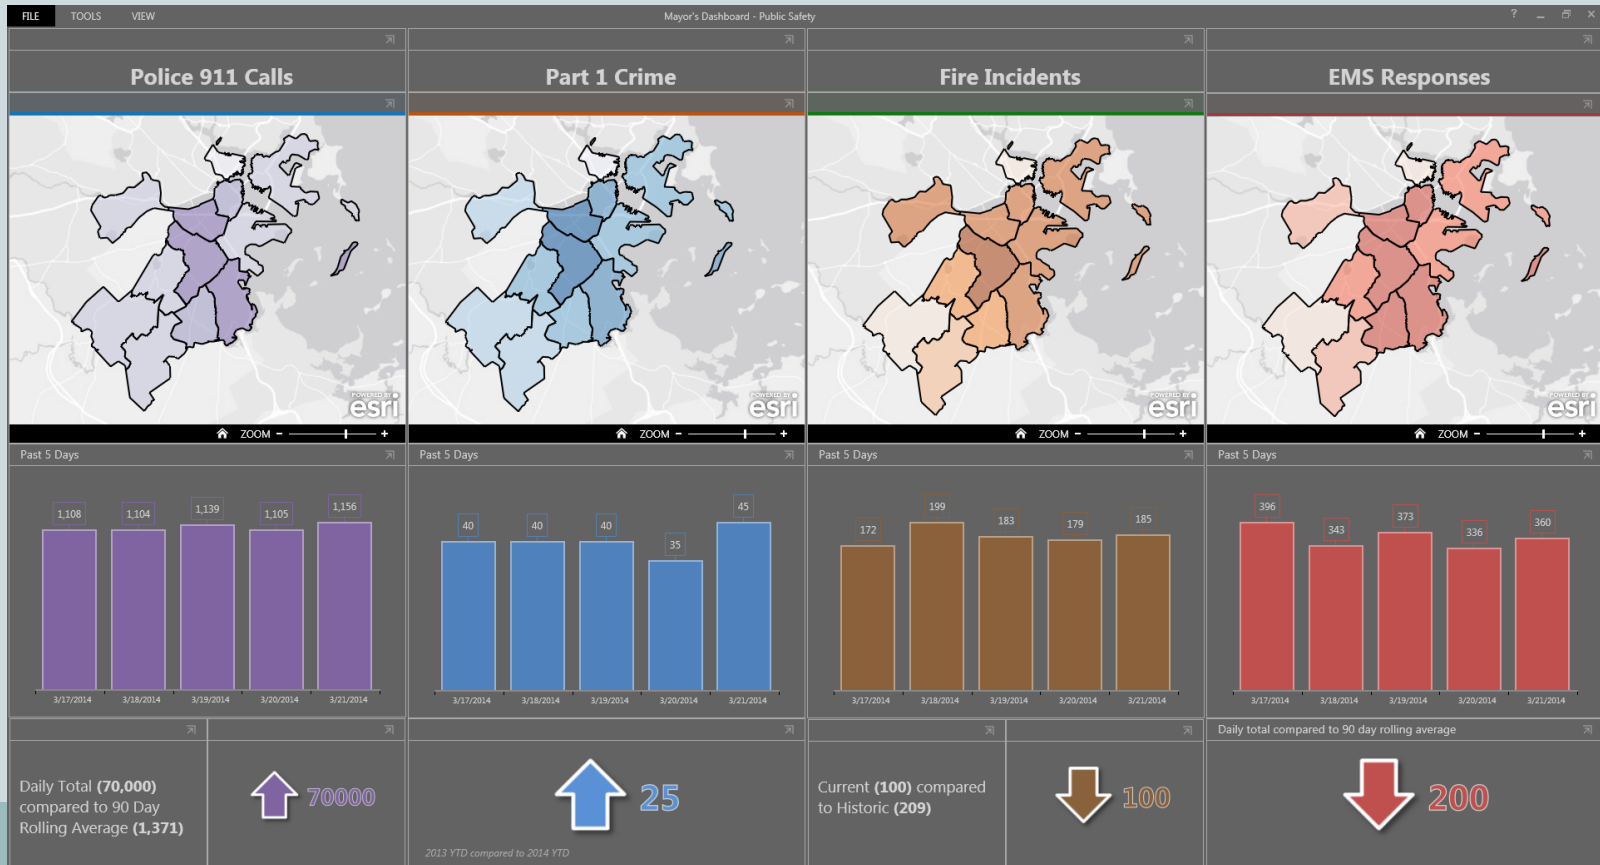

Use in Science, Policy and Practice

- Interpreting microspatial patterns
- Examining dynamic relationships
- Combining with traditional methodologies
- Supporting neighborhood interventions and experiments.
- From methodology to dashboards.

Use in Science, Policy and Practice

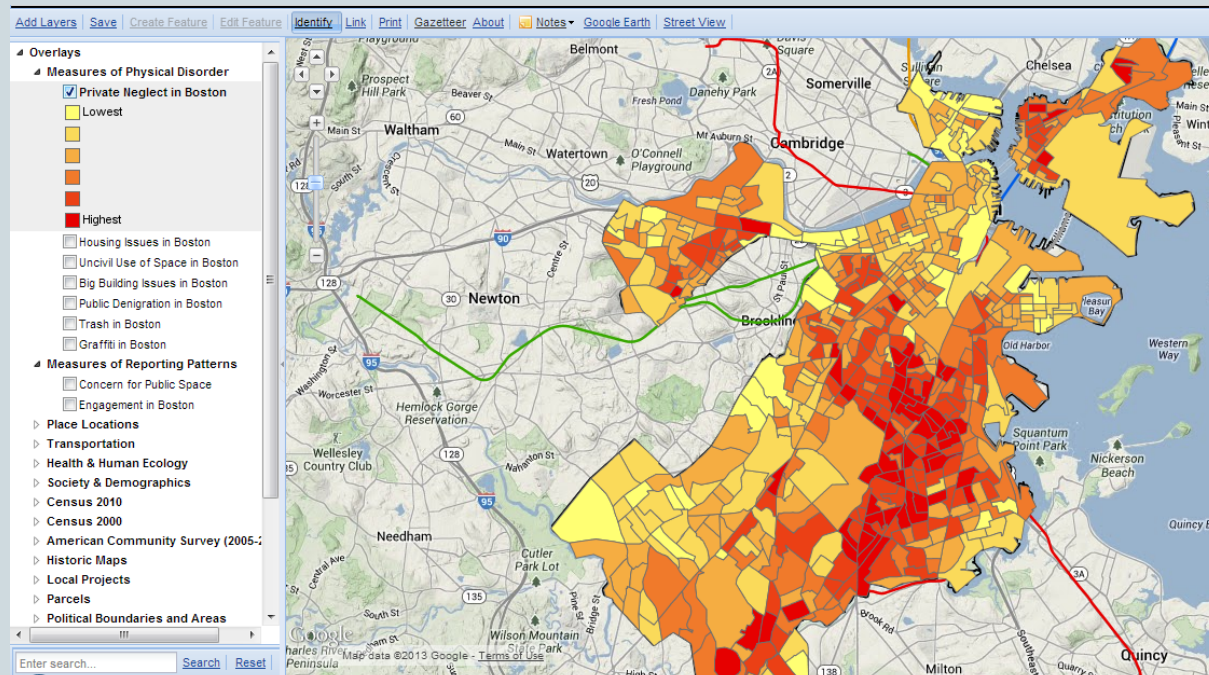

- Efforts to incorporate into City operations.

Final Thoughts

Final Thoughts

- Can city-university partnerships evolve into city-university-community partnerships?
- The danger (and opportunity) of feedback loops.
- How do we leverage modern digital data to study and track sustainability?
- The value of bias: custodianship and the maintenance of the urban commons.
