

ICARUS

[About ICARUS](#) [Technical Challenge](#) [Technical Solution](#) [Science & Projects](#) [Participants](#) [Publications](#) [Photos](#)

International Cooperation for Animal Research Using Space
ICARUS' mission is working towards establishing a remote sensing platform for scientists world-wide that can track small organisms globally, using radio transmitters a small as 0.3 grams enabling observations and experiments over large spatial scales.
ICARUS is currently in the process of:
1. Designing the technical (satellite) solution
2. Soliciting scientific input.

EEG radio transmissions using a 0.4 g transmitter

Flat EEG **SWS peaks** **SWS and some pauses** **Mostly SWS**

**Heart rate: 320 beats/min; (3/7/06
166.6805MHz, 9:30am)**

Why track animals and record physiological functions?

How animals deal with a changing environment?

What environmental cues do they use?

How are these cues signaled: sensory modalities and neural pathways?

Need micro-techniques to identify what processes are important and how they are operating

Nanotechnology for following these changes in free-living animals
